climate change is one of the most important environmental problems faced by planet
earth the majority of co2 emissions come from burning fossil fuels for energy
production and improvements in energy efficiency shows the greatest potential for
any single strategy to abate global greenhouse gas ghg emissions from the energy
sector energy related emissions account for almost 80 of the eu s total greenhouse
gas emissions the building sector is the largest energy user responsible for about 40
of the eu s total final energy consumption in europe the number of installed air
conditioning systems has increased 500 over the last 20 years but in that same

period energy cooling needs have increased more than 20 times the increase in energy cooling needs relates to the current higher living and working standards in urban environments with low outdoor air quality the general case this means that in summer time one cannot count on natural ventilation to reduce cooling needs do not forget the synergistic effect between heat waves and air pollution which means that outdoor air quality is worse in the summer aggravating cooling needs over the next few years this phenomenon will become much worse because more people will live in cities more than 2 billion by 2050 and global warming will aggravate cooling needs an overview of materials to lessen the impact of urban heat islands excellent coverage of building materials to reduce air conditioning needs innovative products discussed such as thermo and electrochromic materials

towards energy efficient buildings envelope technologies and sustainable energy systems examines the intersection of building design and energy systems analysis paving the way to sustainable efficient buildings and our communal energy future this book begins by outlining the major energy challenges for buildings and the fundamentals and opportunities in envelope technology for their increasing the efficiency of their energy systems close analysis of various technologies is then carried out including case studies and demonstrations of impact assessment techniques the ways in which these technologies interact with energy systems within the building are drawn out and clarified for a range of readers finally detailed guidance on energy system assessment and analysis is provided bringing together these two essential disciplines for sustainable living towards energy efficient buildings will support energy engineers researchers and students of energy systems in developing technologies for energy efficient sustainable buildings breaks down the fundamentals of building envelope design for an energy engineer readership includes a variety of case studies and practical technologies with clear real world impacts on building energy systems and management leads the reader through comprehensive assessment methodologies to analysis energy system outcomes and enable sustainable cities for the future
